## CHEMICAL COMPOUNDS

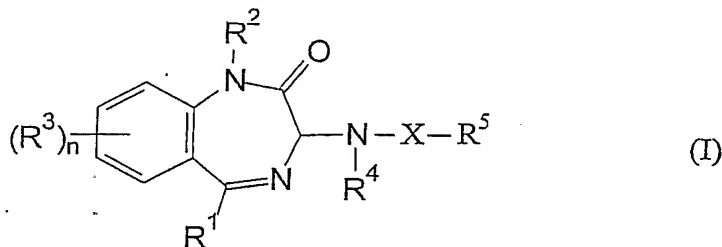

The present invention relates to a series of benzodiazepine derivatives which  
5 are active against Respiratory Syncytial Virus (RSV).

RSV is a major cause of respiratory illness in patients of all ages. In adults, it tends to cause mild cold symptoms. In school-aged children, it can cause a cold and bronchial cough. In infants and toddlers it can cause bronchiolitis (inflammation of the smaller airways of the lungs) or pneumonia. It has also been found to be a  
10 frequent cause of middle ear infections (otitis media) in pre-school children. RSV infection in the first year of life has been implicated in the development of asthma during childhood.

Current anti-RSV therapy involves the use of a monoclonal antibody to RSV, called palivizumab. Such use of palivizumab is a prophylactic, rather than  
15 therapeutic, treatment of RSV. However, although this antibody is often effective, it is expensive. Indeed, its expense means that it is unavailable for many people in need of anti-RSV therapy. There is therefore an urgent need for effective alternatives to existing anti-RSV therapy.

It has now surprisingly been found that the particular benzodiazepine  
20 derivatives of the general formula (I) set out below are active against RSV.

Accordingly, the present invention provides, in a first embodiment, the use of a compound which is (a) a benzodiazepine derivative of formula (I) or an N-oxide thereof, or (b) a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for use in treating or preventing an RSV infection

Compounds of formula (I) may be prepared by reacting glyoxylic acid ( $\text{HCO}-\text{CO}_2\text{H}$ ), benzotriazole and an appropriate benzyl carbamate at reflux in toluene, under Dean-Stark conditions giving the key protected amino acid of formula (II)

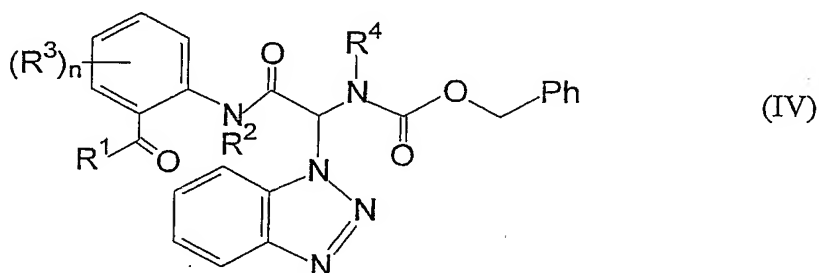

5

The thus obtained amino acid of formula (II) can then be reacted with a suitable chlorinating agent, such as oxalyl chloride, followed by reaction with a 2-aminobenzophenone of formula (III)

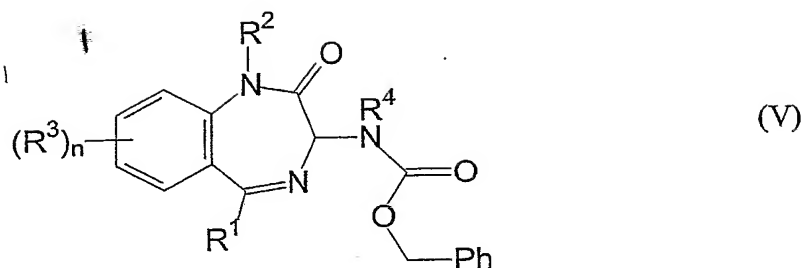

10 to give the intermediate amide of formula (IV)

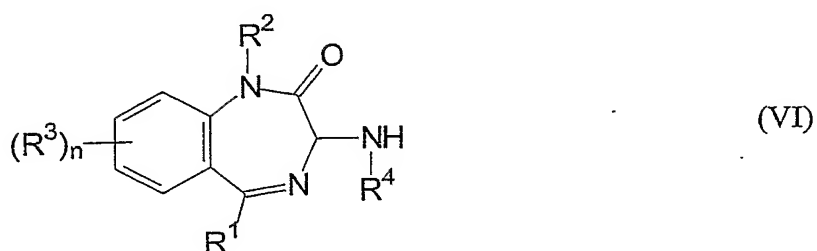

which need not be characterized.

The compound of formula (IV) can then be subjected to ammonolysis followed by ring closure in acetic acid containing ammonium acetate to obtain the protected benzodiazepine of formula (V)

15

The compound of formula (V) can then be deprotected using hydrogen bromide in acetic acid to yield the deprotected amine of formula (VI).

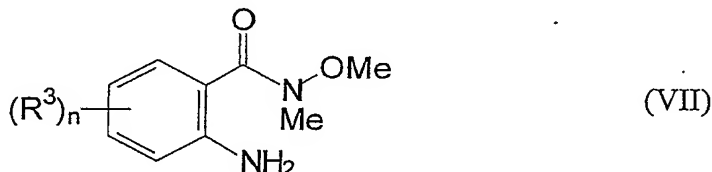

- 5 Compounds of formula (I), in which X is -CO- or -CO-NR' can be prepared by reacting a compound of formula (VI), as defined above, with an acid anhydride in a suitable solvent, preferably pyridine at ambient temperature, or with an acid chloride in a suitable solvent in the presence of a base, preferably in THF at ambient temperature with triethylamine present. Alternatively, the compounds can be
- 10 produced by reaction of a compound of formula (VI) with an acid in a suitable solvent in the presence of a base and a coupling agent, preferably in THF at ambient temperature with triethylamine and *O*-benzotriazol-1-yl-N, N, N', N'-tetramethyluronium hexafluorophosphate (HBTU) present.

- 15 If the acid chloride used is an amino carbonyl chloride, the compound of formula (I) is a urea. In the case where R' in the X moiety is hydrogen, such compounds may also be prepared by the reaction of a compound of formula (VI) with an isocyanate. This reaction is preferably carried out in THF at ambient temperature. Alternatively, the isocyanate may be prepared *in situ* from the relevant amine and phosgene, in the presence of a base, usually triethylamine, again in THF.
- 20 Compounds in which R' is other than hydrogen can, of course, be prepared by reacting a corresponding compound in which R' is hydrogen with an appropriate

alkylating agent, for example L-(C<sub>1</sub>-C<sub>6</sub> alkyl) wherein L is a leaving group, for example chlorine.

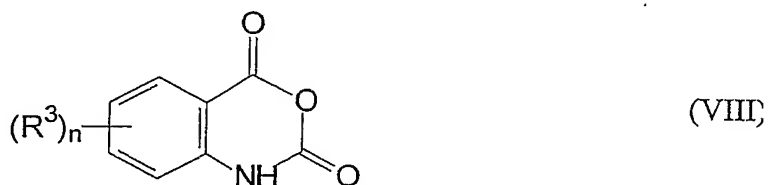

Compounds of formula (I), in which X is -S(O)<sub>2</sub>- may be prepared by the reaction of a compound of formula (VI) with a suitable sulfonyl chloride. Similarly, compounds of formula (I), in which X is -S(O)- may be prepared by the reaction of a compound of formula (VI) with a suitable sulfinyl chloride

In the preparation of the benzodiazepine skeleton, commercially available aminobenzophenone compounds of formula (III) can be used where possible. Compounds of formula (III) which are not commercially available can be prepared by known methods, for example by reaction of a Weinreb type amide of formula (VII)

with a group R<sup>1</sup>-Li or a Grignard reagent such as R<sup>1</sup>-MgBr. Preferably this reaction is carried out in THF at -100°C.

Compounds of formula (VII) are known compounds or can be prepared by analogy with known methods. For example, they can be prepared from the reaction of isatoic anhydrides of formula (VIII)

with N,O-dimethyl hydroxylamine under standard reaction conditions.

The starting materials of formula (II), (III), (VII), and (VIII) are known compounds, or may be prepared by analogy with known methods.

Further synthetic manipulation of the thus obtained compounds of formula (I) may be carried out by conventional methods to achieve further compounds of

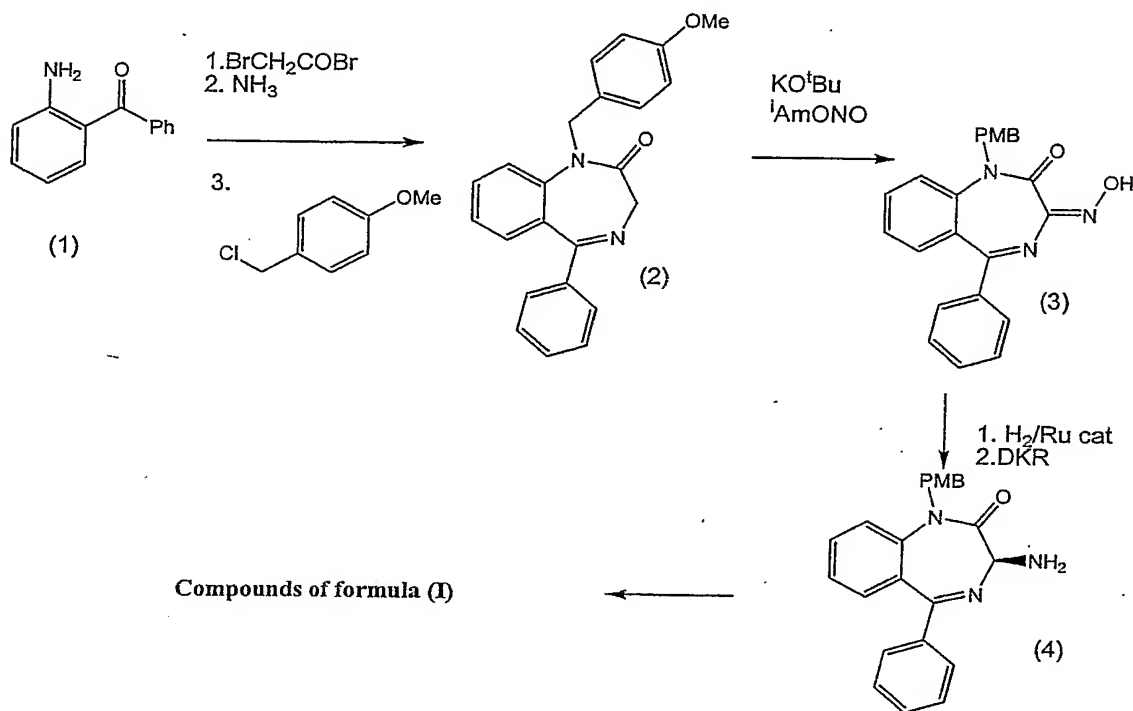

formula (I). The benzodiazepines of formula (I) can be salified by treatment with an appropriate acid or base.

Although the described route to the claimed compounds provides an adequate synthesis for laboratory scale preparations, an alternative route was sought which has potential as a manufacturing route. The same starting material (2-amino-benzophenone) (1) is used in both, however in the alternative route, the benzodiazepine ring system is formed by reaction initially with bromoacetyl bromide (or an equivalent reagent) followed by ring closure with ammonia. These reactions are carried out in a suitable solvent, such as dichloromethane, and at a suitable temperature which may range from -20 to 150°C. In order to protect the NH functionality, at this stage the unsubstituted benzodiazepine is reacted with a base, and an alkylating agent. For instance sodium hydride in DMF followed by addition of 4-methoxy-benzyl chloride gives rise to the intermediate (2) shown below. Further reaction of this material with a base (e.g. potassium tert-butoxide) in a suitable solvent (e.g. THF or DMF) followed by quenching with isoamyl nitrite (or an alternative similar reagent) furnishes the oxime intermediate (3) which may be converted into the racemic primary amine by methods which include the use of hydrogen and a suitable catalyst. This amine then undergoes a Dynamic Kinetic Resolution (DKR) procedure by which the racemic amine in the presence of a suitable optically active acid, and a suitable aldehyde gives rise to precipitation of the salt of the desired (S)-amine (4) in good yield and exceptionally high enantiomeric excess. A suitable acid for this conversion can be e.g. Camphorsulfonic acid, Boc-phenyl alanine or the like, and a suitable aldehyde may be a benzaldehyde such as 3,5-dichloro salicylaldehyde.

The optically amine thus formed may then be transformed into a desired derivative, such as an amide or urea. The amide formations may be carried out using a suitable carboxylic acid and a coupling reagent, or a carbonyl chloride or other suitable reagent, and the ureas prepared using either a suitable isocyanate, or alternatively reaction with phosgene followed by a suitable amine.

These derivatives thus formed may then have the protecting group removed. This may be carried out in the presence of a Lewis Acid, such as aluminium chloride, boron trifluoride, titanium tetrachloride, or the like. These reactions are carried out

in a suitable inert solvent, such as dichloromethane. Reaction temperatures may range from -20 to 150°C, but are typically carried out at room temperature or below.

As explained above, the compounds of the invention are active against RSV. The present invention therefore provides a method for treating a patient suffering from or susceptible to an RSV infection, which method comprises administering to said patient an effective amount of a compound of formula (I) or a pharmaceutically acceptable salt thereof.

RSV is prevalent among children younger than two years of age, adults suffering from asthma, chronic obstructive pulmonary disorder (COPD) or immunodeficiency and the elderly. It is a particularly serious risk amongst children who suffer from chronic lung disease. Accordingly, the said composition or medicament is typically for use in treating a patient who is a child under two years of age, patients with asthma, COPD or immunodeficiency the elderly or persons in long term care facilities. Typically, said child suffers from chronic lung disease.

Further, anti-RSV prophylaxis is recommended for infants born at 32 weeks of gestation or earlier, until they reach 6 months of age, the elderly, persons with

immunodeficiency and those in long term care facilities. Accordingly, the said composition or medicament is typically for use in preventing RSV infection in an infant less than 6 years of age, who was born after 32 weeks of gestation or less, the elderly, persons with immunosufficiency and those in long term care facilities.

5 It has been shown that RSV infections are accompanied by inflammatory reactions (Noah et al, Clinical Immunology 2000, Vol 97, 43-49). The present invention also relates to a combination of a compound of formula (I), or a pharmaceutically acceptable salt thereof, with an anti-inflammatory compound and the use of such a combination in the treatment of RSV. Typically, said anti-  
10 inflammatory compound is a steroid, for example budesonide or fluticasone, a non-steroid, for example a leukotriene antagonist, phosphodiesterase 4 inhibitor or TNF alpha inhibitor or an interleukin 8 or interleukin 9 inhibitor.

Thus, in one embodiment, a compound of formula (I), or pharmaceutically acceptable salt thereof, is combined with a steroid antiinflammatory compound, for  
15 example budesonide or fluticasone. In a preferred embodiment, the steroid is administered in low doses to minimize immuno-suppressant effects. In another embodiment a compound of formula (I), or a pharmaceutically acceptable salt thereof, is combined with a non-steroid anti-inflammatory compound, for example leukotriene antagonists such as Singulair (Merck) or Accolate (Astra Zeneca),  
20 phosphodiesterase 4 inhibitors such as roflumilast (Altana), TNF alpha inhibitors such as Enbrel (Amgen), Remicade (Centocor), Humira (Abbott) or CDP870 (Celltech) or NSAIDS. In a further embodiment, a compound of formula (I) is combined with interleukin 8 or interleukin 9 inhibitors. The present invention thus also relates to a product containing a compound of formula (I), or a pharmaceutically  
25 acceptable salt thereof, and an anti-inflammatory compound for simultaneous, separate or sequential use in the treatment of RSV.

The present invention also relates to a combination of a compound of formula (I), or a pharmaceutically acceptable salt thereof, with an anti-influenza compound and the use of such a combination in the treatment of concomitant RSV and  
30 influenza infections. The present invention thus also relates to a product containing a compound of formula (I), or a pharmaceutically acceptable salt thereof, and an anti-influenza compound for simultaneous, separate or sequential use in the treatment of

concomitant RSV and influenza infections.

It is a further surprising finding of the present invention that compounds of the invention are active against human metapneumovirus, measles, parainfluenza viruses, paramyxoviruses and mumps. The present invention thus provides the use  
5 of a compound of formula (I), or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for use in the treatment of human metapneumovirus, measles, parainfluenza viruses, paramyxoviruses and mumps.

The compounds of the invention may be administered in a variety of dosage forms. Thus, they can be administered orally, for example as tablets, troches,  
10 lozenges, aqueous or oily suspensions, dispersible powders or granules. The compounds of the invention may also be administered parenterally, whether subcutaneously, intravenously, intramuscularly, intrasternally, transdermally or by infusion techniques. The compounds may also be administered as suppositories.

In a preferred embodiment, the compounds of the invention are administered  
15 by intranasal or intrabronchial administration. The present invention also provides an inhaler or nebuliser containing a medicament which comprises (a) a benzodiazepine derivative of the formula (I), as defined above, or a pharmaceutically acceptable salt thereof, and (b) a pharmaceutically acceptable carrier or diluent.

The present invention also provides a pharmaceutical composition  
20 containing such a benzodiazepine derivative, or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier or diluent.

Said pharmaceutical composition typically contains up to 85 wt% of a compound of the invention. More typically, it contains up to 50 wt% of a compound of the invention. Preferred pharmaceutical compositions are sterile and pyrogen free.  
25 Further, the pharmaceutical compositions provided by the invention typically contain a compound of the invention which is a substantially pure optical isomer.

The compounds of the invention are typically formulated for administration with a pharmaceutically acceptable carrier or diluent. For example, solid oral forms may contain, together with the active compound, diluents, e.g. lactose, dextrose,  
30 saccharose, cellulose, corn starch or potato starch; lubricants, e.g. silica, talc, stearic acid, magnesium or calcium stearate, and/or polyethylene glycols; binding agents; e.g. starches, arabic gums, gelatin, methylcellulose, carboxymethylcellulose or

polyvinyl pyrrolidone; disaggregating agents, e.g. starch, alginic acid, alginates or sodium starch glycolate; effervescing mixtures; dyestuffs; sweeteners; wetting agents, such as lecithin, polysorbates, laurylsulphates; and, in general, non toxic and pharmacologically inactive substances used in pharmaceutical formulations. Such pharmaceutical preparations may be manufactured in known manner, for example, by means of mixing, granulating, tableting, sugar coating, or film coating processes.

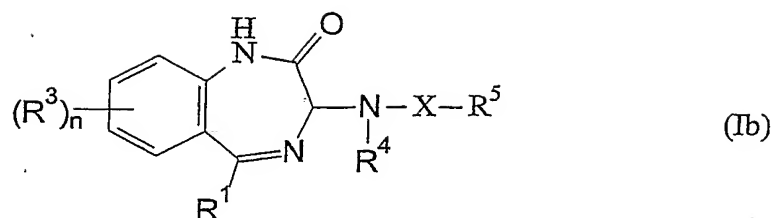

Liquid dispersions for oral administration may be syrups, emulsions and suspensions. The syrups may contain as carriers, for example, saccharose or saccharose with glycerine and/or mannitol and/or sorbitol.

Suspensions and emulsions may contain as carrier, for example a natural gum, agar, sodium alginate, pectin, methylcellulose, carboxymethylcellulose, or polyvinyl alcohol. The suspension or solutions for intramuscular injections may contain, together with the active compound, a pharmaceutically acceptable carrier, e.g. sterile water, olive oil, ethyl oleate, glycols, e.g. propylene glycol, and if desired, a suitable amount of lidocaine hydrochloride.

Solutions for injection or infusion may contain as carrier, for example, sterile water or preferably they may be in the form of sterile, aqueous, isotonic saline solutions.

A therapeutically effective amount of a compound of the invention is administered to a patient. A typical dose is from about 0.001 to 50 mg per kg of body weight, according to the activity of the specific compound, the age, weight and conditions of the subject to be treated, the type and severity of the disease and the frequency and route of administration. Preferably, daily dosage levels are from 5 mg to 2 g.

Certain benzodiazepine derivatives of the formula (I) are novel *per se*. The present invention includes these novel compounds and pharmaceutically acceptable salts thereof. The present invention therefore also provides compounds of formula (Ib), or a pharmaceutically acceptable salt thereof

wherein  $R_1$ ,  $R_3$ ,  $n$ ,  $R_4$ ,  $X$  and  $R_5$  are as defined above.

Typically, in the formula (Ib),  $R_1$  is an unsubstituted phenyl group.

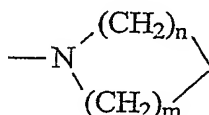

5 Typically, in the formula (Ib), when  $A_1$  is a heteroaryl group, it is other than a 5-methyl-isoxazolyl moiety.

Typically, in the formula (Ib),  $A_1$  is an aryl or heteroaryl moiety.

Typically, in the formula (Ib),  $X$  is  $-\text{CO}-$  or  $-\text{CO}-\text{NR}'-$ , wherein  $R'$  is as defined above, provided that when  $X$  is  $-\text{CO}-\text{NR}'-$ , the moiety  $-\text{A}_1-\text{Y}-\text{A}_2$  is -phenyl-  
 10 O-phenyl.

Typically, in the formula (Ib),  $A_2$  is other than a 4- to 10- membered saturated cycloalkyl ring, in which one of the carbon atoms is replaced by a N atom. In particular,  $A_2$  is typically other than a substituted or unsubstituted moiety of the formula

15

wherein  $n$  and  $m$  are the same or different and each represent an integer of from 1 to 4.

20 Typically, in the formula (Ib),  $A_2$  is a piperazinyl, pyridyl, pyrrolidinyl, pyrazinyl, cyclopropyl, phenyl or S,S-dioxo-thiomorpholino group which is unsubstituted or is substituted by a  $\text{C}_1$ - $\text{C}_2$  alkyl group.

The present invention also relates to the novel compounds, as defined above, or a pharmaceutically acceptable salt thereof, for use in a method of treating the  
 25 human or animal body. The present invention also relates to a pharmaceutical composition comprising a novel compound as defined above and a pharmaceutically acceptable diluant or carrier. Preferably, the pharmaceutical composition comprises

a pharmaceutically acceptable salt of a novel compound as defined above. A pharmaceutically acceptable salt is as defined above. The novel compounds of the invention are typically administered in the manner defined above and the compounds are typically formulated for administration in the manner defined above.

5            Preferably, the pharmaceutical compositions comprise optically active isomers of the novel compounds of the invention. Thus, for example, preferred novel compounds of the invention containing only one chiral centre include an R enantiomer in substantially pure form, an S enantiomer in substantially pure form and enantiomeric mixtures which contain an excess of the R enantiomer or an excess  
10 of the S enantiomer. It is particularly preferred that pharmaceutical contains a compound of the invention which is a substantially pure optical isomer. For the avoidance of doubt, the novel compounds of the invention can, if desired, be used in the form of solvates.

          The following Examples illustrate the invention. They do not however, limit  
15 the invention in any way. In this regard, it is important to understand that the particular assays used in the Examples section are designed only to provide an indication of anti-RSV activity. There are many assays available to determine the activity of given compounds against RSV, and a negative result in any one particular assay is therefore not determinative.

## ACTIVITY EXAMPLE 1

### XTT Assay Protocol

- 5 The inner 60 wells of 96 well tissue culture plates were seeded with Hep-2 cells at  $4 \times 10^4$  cells/well for compound activity and toxicity studies in 100  $\mu$ l of medium and incubated at 37°C overnight or until nearing confluency.

- 10 Cells were infected with 25  $\mu$ l RSV previously titrated to give 80% cell kill. To each well 25  $\mu$ M of test compound were added. The final DMSO concentration was 0.5%. Some 200  $\mu$ l of sterile distilled water were added to the outer wells of the plate and incubated at 37°C for 6 days. Some 0.25  $\mu$ l/ml PMS were added to stock XTT solution, final conc. 25  $\mu$ M PMS. Then 25  $\mu$ l warmed XTT/PMS solution were added to each well and incubated for 1 hour at 37°C.

- 15 Maximum OD<sub>450nm</sub> reading (uninfected, untreated control cells) corresponded to 100% inhibition. Minimum OD<sub>450nm</sub> readings (infected control cells) corresponded to 0% inhibition. Log10 concentration was plotted against OD<sub>450nm</sub> and IC<sub>50</sub> values were calculated from either reading 50% value from graph or using regression
- 20 analysis.
